Summary

Senior full-stack engineer (14+ years, remote-first) who designs and ships multi-tenant SaaS with CRM-style data models: people, accounts, properties, documents, messaging, tasks, and operational workflows. Hands-on across architecture, solution design, development, and code review.

Leads AI adoption for engineering and management. Builds reusable agent skills, MCP servers, and AI-assisted workflows in Cursor, Claude Code, and Codex so teams can work on product data and codebases without leaking context or skipping human review.

Experience

Senior Software Engineer, WealthPark – Tokyo, Japan (Remote) Apr 2021 – Present

- Own end-to-end delivery of a multi-product property operations platform (CRM-style): owners, operators, listings, documents, chat, activities, and marketing workflows for customer success.
- Model relational domain data and GraphQL APIs so operators, owners, and CSMs share one operational picture without duplicating records across chat, documents, and activity streams.
- Lead AI adoption for developers and managers: Cursor, Claude Code, and Codex; authored skills and playbooks; stood up MCP servers so agents can use repo, docs, and workflow tools under explicit permissions.
- Treat AI output as draft work: code review, architecture review, and human-in-the-loop checks before merge; document how tools may access tenant-adjacent product data.
- Architected store-management caching that improved speed by up to 2698%; shipped a React/TypeScript component system reused across operator, owner, and valuation products.
- Mentor interns and junior engineers; set standards for design, testing, and AI-assisted development so the team can ship independently.

Full Stack Engineer, MerchantSpring – Melbourne, Australia (Remote) Sept 2020 – Apr 2021

- Built marketplace-integration microservices (Amazon, eBay, Walmart, Shopify) that isolate merchant accounts and aggregate shop data through public and private APIs.
- Designed multi-account analytics for agencies and investors: per-tenant datasets, Node.js services, MySQL/MongoDB, Docker, and Terraform-backed deploys.
- Owned CI confidence with Jest and Cypress, plus stakeholder demos so product owners could approve releases against live marketplace behavior.

Front End Engineer, Rakuten – Tokyo, Japan June 2018 – Sept 2020

- Reusable React search/booking components; led animation/reusability; unit, integration, and snapshot tests on booking-critical paths.

Software Engineer, Bosch, NEC, Denso – Tokyo / Manila Apr 2014 – June 2018

- Bosch: VIN identification and CAN diagnostics against a centralized vehicle database (TDD, GRADE-X).
- NEC: network/traffic sniffer analysis with unit, functional, and integration coverage.
- Denso: spec-driven ECU software for Japan requirements, including a complex spec with zero defects on first unit-test pass.

Selected platforms

PotatoV3 — operator CRM / property ops WealthPark

- Admin/operator console for ownership identification, owner communication, and operational work (TypeScript, React, Next.js, REST, WebSocket).

Chat Admin + documents WealthPark

- Agent–owner messaging, activity creation, and document handling on the same operational record (React, Redux, WebSocket, REST).

Workflow WealthPark

- Human-operated activity streams for expenses, income, and property updates — approval-style operational work, not fire-and-forget automation.

Owner Web Application WealthPark

- Owner-facing cash flow, documents, chat, and activities across global properties (TypeScript, React, GraphQL).

MerchantSpring Seller Tool MerchantSpring

- Multi-account marketplace analytics with tenant-separated merchant data, APIs, and CI (Node.js, Express, MySQL, MongoDB, Docker, Terraform).

AI operating model

Shared agent skills for engineers (architecture, implementation, review) and managers (planning, status, stakeholder write-ups) so Cursor, Claude Code, and Codex follow the same rules.

MCP servers as the tool boundary: agents only get repo, docs, and workflow tools we expose; product data is not dumped into prompts by default.

Human-in-the-loop: generated code, specs, and process changes go through review; structured outputs for tickets and review notes so the work is auditable.

Skills

Architecture: Multi-tenant SaaS, CRM-style relational modeling, GraphQL/REST APIs, integrations, caching, component systems, evented UI (WebSocket)

AI delivery: AI-assisted architecture and development, agent skills, MCP servers, Cursor, Claude Code, Codex, human-in-the-loop review, permission-aware tool use

Languages & data: TypeScript, JavaScript, C#, Rust, SQL, PostgreSQL, GraphQL, MongoDB, MySQL

Stack: React, Next.js, Node.js, NestJS, C# / .NET backends, Rust services, Docker, Terraform, Jest, Cypress, CI/CD

Education

Rizal Technological University, BS in Computer Engineering – Mandaluyong, Philippines Mar 2008 – Mar 2013

Certifications

JLPT: Japanese Language Proficiency Test N3

JTEST: D Level
